# Accessibility & performance

**This course:** Make your apps production-ready: tested, fast, accessible and deployed automatically.

## Run an audit

Open DevTools → **Lighthouse**, choose Mobile, tick Performance and Accessibility, then **Analyze page load**. Fix the top items first and run it again. Aim for 90+ in Accessibility.

## Accessibility checklist

- Every image has meaningful `alt` text (or `alt=""` if it's decorative).
- Every form field has a `<label>`.
- You can use the whole page with only the keyboard, and focus is always visible.
- Text contrast is at least 4.5:1.
- Headings go in order (h1, h2, h3) and buttons are real `<button>` elements.

## Performance checklist

- Resize and compress images; use `loading="lazy"` for images below the fold.
- Lazy-load pages with `React.lazy` so the first load is smaller.
- Check the output of `npm run build`: big files are a sign of heavy libraries.
- Remove unused dependencies.

## Research questions

Answer these in the app, in your own words, to unlock the next lesson.

1. Fix the top 3 Lighthouse issues on your Book finder.
2. Which of your pages could be lazy loaded?

## Start your research here
