Build & deploy

This course: Make your apps production-ready: tested, fast, accessible and deployed automatically.

Build

```
npm run build
# creates the dist/ folder: plain HTML, CSS and JavaScript ready for any host
```

Preview the production build locally with `npm run preview` before deploying.

Deploy to Netlify or Vercel

- Push your project to GitHub.
- Sign in to Netlify or Vercel with GitHub and import the repository.
- Build command: `npm run build`. Output directory: `dist`.
- Add environment variables (anything starting with `VITE_`) in the host's settings.
- Deploy. Every push to main now redeploys automatically.

Fix 404s on refresh

A React app has one real file, `index.html`. If someone refreshes `/tasks/3`, the host looks for a file that doesn't exist. Tell it to send every path to index.html:

```
# Netlify: public/_redirects
/*  /index.html  200

# Vercel: vercel.json
{ "rewrites": [{ "source": "/(.*)", "destination": "/" }] }
```

Research questions

Answer these in the app, in your own words, to unlock the next lesson.

1. Why does refreshing `/tasks/3` 404 on some hosts?
2. Deploy your capstone draft.
