BONUS COURSE · TAILWIND CSS · WEDNESDAY · LESSON GUIDE

Responsive design, states & dark mode

This course: Style React apps fast with Tailwind's utility classes, and compare it with Bootstrap.

Responsive design: mobile first

Classes without a prefix apply to every screen size. Add a prefix to change something from a breakpoint upwards: `sm:` (640px+), `md:` (768px+), `lg:` (1024px+), `xl:` (1280px+).

```
<div class="grid grid-cols-1 gap-4 sm:grid-cols-2 lg:grid-cols-3">
  <Card /> <Card /> <Card />
</div>
```

Design for the phone first, then add prefixes as the screen gets wider. That's the opposite of how many people learned CSS, and it keeps your classes short.

Interaction states

```
<button class="bg-indigo-600 hover:bg-indigo-500 focus-visible:outline-2
               focus-visible:outline-offset-2 disabled:opacity-50">
  Save
</button>
```

- `hover:` when the pointer is over it.
- `focus-visible:` when it's reached with the keyboard. Always keep a visible focus style.
- `disabled:` when the button can't be used.

Dark mode

`dark:` applies a style when the device is set to dark mode. Pair every background and text colour with its dark version:

```
<div class="bg-white text-slate-900 dark:bg-slate-900 dark:text-slate-100">…</div>
```

Research questions

Answer these in the app, in your own words, to unlock the next lesson.

1. Make a card grid that shows 1, 2 and 3 columns at different widths.
2. Add a dark mode to your navbar.
