FLE TRIBE

WEEK 00 · TUESDAY · LESSON GUIDE

Career paths in tech

This week: Understand the industry you are entering, the roles inside it, and exactly where a frontend developer fits, so the next 5 months make sense.

Engineering roles

- **Frontend developer**: builds what users see and interact with in the browser.
- **Backend developer**: builds the servers, APIs and databases behind the scenes.
- **Full-stack developer**: works on both, usually after starting on one side.
- **Mobile developer**: builds iOS and Android apps.
- **DevOps / cloud engineer**: automates deployment and keeps systems running.
- **QA / test automation**: writes tests and checks quality before release.

People you'll work with every day

- **UI/UX designer**: gives you the designs (usually in Figma) you turn into code.
- **Product manager**: decides what to build next and why.
- **Scrum master / delivery lead**: runs the team's planning and stand-ups.
- **Technical writer**: documents how things work.

Career levels

- **Intern**: learning on the job with close supervision.
- **Junior (0–2 years)**: completes well-defined tasks, asks lots of questions.
- **Mid-level (2–5 years)**: owns features end to end with little help.
- **Senior (5+ years)**: designs solutions, reviews others' code, mentors juniors.
- **Lead / Staff / Manager**: sets technical direction or manages people.

Reading a job ad

Job ads list more than they truly need. Split each requirement into **must have** (usually HTML, CSS, JavaScript, one framework such as React, Git) and **nice to have**. If you match most of the must-haves, apply.

Research questions

Answer these in the app, in your own words, to unlock the next lesson.

1. Find 3 real junior frontend job ads. List every skill they ask for.
2. Which skills appear in all 3? Which ones appear only once?
