FLE TRIBE

WEEK 13 · MONDAY · LESSON GUIDE

# Thinking in React & lifting state

**This week:** Decide where state lives, build forms, and share data across your app.

## Thinking in React: 5 steps

- **Break the design into components**: draw boxes around each part.
- **Build a static version** with props only, no state.
- **Find the minimal state**: what changes over time and can't be calculated?
- **Decide where state lives**: the closest parent of every component that needs it.
- **Pass functions down** so children can ask the parent to change state.

## Lifting state up

```
function App() {
  const [tasks, setTasks] = useState([]);
  const addTask = (title) => setTasks([...tasks, { id: Date.now(), title }]);
  return (
    <>
      <TaskForm onAdd={addTask} />
      <TaskList tasks={tasks} />
    </>
  );
}
```

`TaskForm` and `TaskList` both need the tasks, so they live in `App`.

## Research questions

Answer these in the app, in your own words, to unlock the next lesson.

1. Draw the component tree for a to-do app. Where does the task list live?
2. What does "lifting state up" solve?
