FLE TRIBE

WEEK 14 · WEDNESDAY · LESSON GUIDE

Nested routes, layouts & protected pages

This week: Synchronise with the outside world using effects, and build multi-page apps with React Router.

Shared layouts

```
<Route element={<Layout />}>
  <Route path="/" element={<Home />} />
  <Route path="tasks/:id" element={<TaskDetail />} />
</Route>

function Layout() {
  return (<><Header /><main><Outlet /></main></>);
}
```

Params and search params

```
const { id } = useParams();               // /tasks/42 → '42'
const [params, setParams] = useSearchParams();
const filter = params.get('status') ?? 'all'; // /tasks?status=done
```

Protected pages

```
function RequireUser({ children }) {
  const user = useUser();
  if (!user) return <Navigate to="/login" replace />;
  return children;
}

<Route path="favourites" element={<RequireUser><Favourites /></RequireUser>} />
```

This hides the page in the app. Real data must also be protected on the server.

Research questions

Answer these in the app, in your own words, to unlock the next lesson.

1. Build a layout with a header that stays on every page.
2. How would you stop a signed-out user opening a "favourites" page?
