FLE TRIBE

WEEK 16 · THURSDAY · LESSON GUIDE

Custom domains & going live

This week: Put your React apps online with Vercel: live links, environment variables, preview deployments and your own domain.

Your own domain

- Buy a domain from a registrar (for example a .com or .com.ng).
- In Vercel: Project → **Settings** → **Domains** → add your domain.
- Vercel shows the DNS record to add at your registrar: an **A** record (points the domain to an address) or a **CNAME** (points a subdomain like www to another name).
- Wait for DNS to update (minutes to a few hours). HTTPS is set up for you.

Going-live checklist

- Every page loads, including after a refresh.
- Works on a phone.
- Environment variables set on Vercel.
- Lighthouse accessibility and performance checked.
- Live link in your README.

Research questions

Answer these in the app, in your own words, to unlock the next lesson.

1. What DNS record does Vercel ask you to add, and why?
2. Run Lighthouse on your live site. What's your score?
