FLE TRIBE

WEEK 16 · TUESDAY · LESSON GUIDE

Deploy a React app to Vercel

This week: Put your React apps online with Vercel: live links, environment variables, preview deployments and your own domain.

Deploy in five steps

- Push your project to GitHub.
- Go to **vercel.com** and sign in with GitHub.
- Click **Add New** → **Project** and import your repository.
- Vercel detects Vite: build command `npm run build`, output directory `dist`.
- Click **Deploy**. In about a minute you get a live link.

Every push redeploys

From now on, every push to `main` deploys automatically. Your live site always matches your latest code.

When a deploy fails

Open the deployment and read the **build log** from the bottom up. Run `npm run build` locally to reproduce the error, fix it, and push again.

Research questions

Answer these in the app, in your own words, to unlock the next lesson.

1. Deploy your Product catalogue and share the link.
2. Break the build on purpose. Where does Vercel show the error?
