FLE TRIBE

WEEK 17 · MONDAY · LESSON GUIDE

Plan your capstone

This week: Plan an original React app and build its core feature.

Pick a real problem

The best capstones solve a small problem someone actually has: a church or club needing an events page, a tutor tracking students, a shop showing its menu. A real user gives you real feedback, and a better story in interviews.

Write a 10-line spec

- **Who** is it for?
- **What problem** does it solve, in one sentence?
- **Pages**: list them (e.g. Home, List, Detail, Add new).
- **Features**: what can someone do on each page?
- **Data**: where does it come from: an API, a JSON file, or what the user types?

Find the smallest useful version

Cut your feature list until what's left can be built in three days and is still useful. Everything else goes on a "later" list. Shipping something small that works beats half-finishing something big.

Sketch before you code

Draw each page on paper or in Figma: boxes for the main parts and the buttons. Your sketch becomes your component tree tomorrow.

Research questions

Answer these in the app, in your own words, to unlock the next lesson.

1. Write your spec in 10 lines or fewer.
2. Which feature is the smallest version that's still useful?
