FLE TRIBE

WEEK 17 · TUESDAY · LESSON GUIDE

Set up & component tree

This week: Plan an original React app and build its core feature.

Set up

```
npm create vite@latest my-capstone -- --template react
cd my-capstone
npm install
npm install bootstrap react-router-dom
npm run dev
```

Import Bootstrap once in `main.jsx`: `import 'bootstrap/dist/css/bootstrap.min.css';`

From sketch to components

- Draw a box around every part of your sketch that repeats or has one clear job. Each box becomes a component.
- Name components after what they show: `EventCard`, `EventList`, `SearchBar`.
- Decide where each piece of state lives: in the lowest component that all its users share.

Work in small steps

- Make one thing work, then commit: `git commit -m "Show events from the API"`.
- If something breaks, you can always go back to the last working commit.
- Push to GitHub at the end of every session.

Research questions

Answer these in the app, in your own words, to unlock the next lesson.

1. Draw your component tree.
2. What did you have to change from your plan, and why?

Start your research here
