FLE TRIBE

WEEK 07 · TUESDAY · LESSON GUIDE

Objects

This week: Work with lists and records of data, and write clean modern JavaScript.

An object describes one thing

```
const student = {
  name: 'Ada',
  age: 21,
  scores: [72, 85, 90],
};

student.name;        // 'Ada'
student['age'];      // 21
student.city = 'Lagos'; // add a property
```

Arrays of objects

Most real data is a list of objects: products, users, tasks.

```
const products = [
  { id: 1, name: 'Notebook', price: 1500 },
  { id: 2, name: 'Pen', price: 300 },
];
products[1].name; // 'Pen'
```

Destructuring and spread

```
const { name, age } = student;          // pull values out
const older = { ...student, age: 22 };  // copy and change one value
const more = [...scores, 100];          // copy an array and add
```

Copy vs reference

`const b = a` doesn't copy an object: both names point to the same one, so changing `b` changes `a`. Use spread (`{ ...a }`) to make a copy.

Research questions

Answer these in the app, in your own words, to unlock the next lesson.

1. Model a student as an object with a name and three scores.
2. What is the difference between copying an object and referencing it?
