FLE TRIBE

WEEK 08 · TUESDAY · LESSON GUIDE

Creating & updating elements

This week: Make pages interactive: change what's on screen and respond to clicks, typing and forms.

Create, fill, add

```
const list = document.querySelector('#tasks');

const item = document.createElement('li');
item.textContent = 'Buy data';
item.classList.add('task');
list.append(item);
```

Render a list from data

Keep your data in an array, and rebuild the list from it whenever it changes:

```
function render(tasks) {
  list.innerHTML = ''; // clear
  for (const task of tasks) {
    const li = document.createElement('li');
    li.textContent = task.title;
    list.append(li);
  }
}
```

Why textContent, not innerHTML

`innerHTML` treats text as HTML. If a user types `<img src=x onerror=alert(1)>` as a task name, it runs. `textContent` always shows text as text. Use it for anything a user typed.

Removing and updating

- `element.remove()` deletes it from the page.
- `element.classList.toggle('done')` switches a class on and off.
- `element.setAttribute('aria-pressed', 'true')` changes an attribute.

Research questions

Answer these in the app, in your own words, to unlock the next lesson.

1. Show an array of 5 products as a list on the page.
2. What can go wrong when you put user input into `innerHTML`?
